

Focus On... Vaccine-Preventable Diseases Charlotte County

Vaccines bring us closer to a healthier, more prosperous world where no one suffers or dies from a vaccine-preventable disease. - World Health Organization. (2021) World Immunization Week

Total number of vaccine-preventable cases in Florida²

Florida Health Department, 2022

What Are Vaccine-Preventable Diseases?¹

Vaccine Preventable Diseases (VPDs) are conditions caused by bacteria and viruses that can be prevented by vaccines. These diseases can cause long-term illness, hospitalization, and even death. Examples of VPDs are: [COVID-19](#), [Whooping Cough \(Pertussis\)](#), [Chickenpox \(Varicella\)](#), [Measles](#), [Meningococcal disease](#), and [Pneumococcal diseases](#).

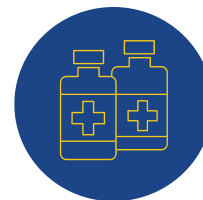

What Are The Benefits of Vaccines?¹

The Centers for Disease Control and Prevention (CDC) defines vaccines as a preparation that is used to stimulate the body's immune response against diseases.

Vaccines help the body create protective antibodies—proteins that help fight off infections. By getting vaccinated, you can protect yourself and also avoid spreading preventable diseases to other people in your community. Unvaccinated children are at increased risk of VPD like mumps, pertussis, and varicella.
